Funding: Florida Department of Transportation, District 5

Acknowledgements and Public Input

Hoke Design, Inc. would like to thank the following individuals and organizations for their input and guidance in developing this report.

Stephan C. Harris, Bicycle & Pedestrian Coordinator (Project Manager)
Karl D. Welzenbach, Executive Director
Mike Neidhart, AICP, Senior Transportation Planner
Joan D. Carter, M.A., FDOT District Five Bicycle and Pedestrian Coordinator
Tom Moscoso, Special Projects Supervisor, FDOT District Five
Tony Nosse, P.E., Safety Engineer, FDOT District Five
Pat Pieratte, Safe Routes to Schools Coordinator, FDOT
Mary Schoelzel, Volusia County MPO Liaison, FDOT District Five
Jon Cheney, P.E., Director of Traffic Engineering, Volusia County
Jean Parlow, Planner, Traffic Engineering, Volusia County
Gerald (Jerry) N. Brinton, P.E., Director of Construction Engineering
Susan Loomis, Crossing Guard Supervisor
Saralee L. Morrissey, AICP, Director of Site Acquisition and Intergovernmental Coordination, Volusia County School District
Greg Akin, Director of Student Transportation Services, Volusia County School District
Ms. Alice Gonzalez, Principal, Manatee Cove Elementary School
Mr. Shantell G. Adkins, Asst. Principal, Manatee Cove Elementary School
Gary Willoughby, Assistant General Manager of Planning, Marketing, and Customer Service, VOTRAN
Forrest Norton, FDOT District Five Right of Way Acquisition
Elaine Wilson, Planning and Zoning Analyst, City of Orange City

For project contact information, see Appendix A.

Throughout the year long study, several project coordination meetings were held:

- October 24, 2006: Coordination meeting with school principal, City staff and the crossing guard supervisor
- July 6, 2006: Volusia County School District Staff
- August 16, 2006: Votran Staff
- September 11, 2006: Volusia County Staff (Public Works, Transportation Engineering, Leisure Services)
- November 2, 2006: Florida Department of Transportation, District Five Staff
- December 19, 2006: Volusia County School District Staff and Volusia County Transportation Engineering Staff

In addition, details about this project were presented in meetings for public comment:

- September 12, 2006: School Crossing Guard Supervisors
- September 13, 2006 and October 11, 2006: Bicycle and Pedestrian Advisory Committee (BPAC)
- September 19, 2006: Technical Coordinating Committee (TCC) (also scheduled for April 2007)

- September 19, 2006: Citizens Advisory Committee (CAC) (also scheduled for April 2007)
- September 26, 2006: Volusia County MPO Board (also scheduled for April 2007).

We owe special thanks to those who gave detailed comments during these meetings and presentations.

Section 1: Executive Summary

Executive Summary

This report is one of a series of *Bicycle and Pedestrian Safety Review Study: Assessment Reports* authorized by the Volusia County Metropolitan Planning Organization (MPO) as part of its efforts to develop and expand a network of safe pedestrian and bicycle facilities. Five school sites were evaluated in separate Assessment Reports and ten school walk zone areas were developed further into Implementation Reports.

The Assessment Reports include a description of safety, operational and policy procedures that impact students living within the designated school walk zone area. The scope for the Assessment Reports did not include the creation of a bicycle and pedestrian master plan or the selection of priority projects. To better plan and communicate walk zone area needs, Hoke Design provided master plans for each of the five schools selected for the Assessment phase.

The primary goal of the Assessment Report is to analyze bicycle and pedestrian safety issues for elementary school students and to provide recommendations for improvement. This Study recognizes the specific needs of elementary age students and emphasizes improvement measures that can be implemented both immediately and over time to better serve these children.

A secondary goal of this report is to encourage planning efforts that include analysis of long-term cost tradeoffs related to bicycle and pedestrian safety.

A third goal of this report is to provide a general understanding of costs associated with constructing sidewalks and to suggest funding methods. Efforts to procure funding under this program have already been successful. As part of this Study, the Volusia County MPO submitted several projects for Safe Routes to School funding consideration. Two projects in the City of Edgewater, totaling an estimated \$420,000, were combined and approved for funding through this program.

Priority Projects – Assessment Reports

Although priority projects were not specifically identified on the master plans, they are discussed in the written section of each report. Listed below are the schools selected and sidewalk/trail projects that may serve the students within the walk zone area and are recommended for further review and development.

- **Freedom Elementary School, DeLand**
 - Blue Lake Avenue Wide Sidewalk (Volusia County MPO Feasibility Study will be completed in March 2007)
- **Manatee Cove Elementary School, Orange City**
 - Blue Springs Avenue Wide Sidewalk or WESH TV Trail connection (Volusia County has made considerable effort to implement this sidewalk over the past few years and will construct portions of sidewalk where right of way is available)
- **Pathways Elementary School, Ormond Beach**
 - Airport Road Wide Sidewalk
 - Black Pine Way Connector and Sidewalk Extension

- Circle Creek Way/Briargate Subdivision Connector
- **Sugar Mill Elementary School, Port Orange**
 - Madeline Avenue Wide Sidewalk
 - McDonald Road Sidewalk
 - Charles Street Sidewalk
 - Herbert Street Sidewalks (constrained right of way)
- **Turie T. Small Elementary School, Daytona Beach**
 - Bellevue Avenue Sidewalk, Park Connector and Crosswalk Relocation
 - South Street Wider Sidewalks/Traffic Calming (Engineering Study required)

Priority Projects - Implementation Reports

The Implementation Reports have resulted in a list of potential projects for future funding. Recommended priority projects within the school walk zones were identified and highlighted within each of the Implementation Reports. These recommended projects are:

- **DeBary Elementary School, DeBary**
 - Highbanks Road Sidewalk
 - Naranja Road Sidewalk
- **Friendship Elementary School, Deltona**
 - Florida Drive/Greynolds Street Sidewalk
 - Kimberly Drive/Beal Street Connector
- **Holly Hill Elementary School, Holly Hill**
 - Flomich Street Sidewalks
 - Canal Trail and Sidewalk Connector
 - Alabama Avenue Trail
- **Indian River Elementary School, Edgewater**
 - 30th Street Wide Sidewalk
 - Mango Tree Drive Trail (Received SRTS funding)
 - 27th Street Sidewalk (Received SRTS funding)
- **McInnis Elementary School, unincorporated Volusia County**
 - Baxter Street Sidewalks (Will be submitted for SRTS funding by West Volusia County Community Traffic Safety Team (CTST) in March, 2007)
 - Ponce DeLeon Trail
 - Central Avenue Sidewalks
- **Palm Terrace Elementary School, Daytona Beach**
 - Bill France Blvd. Sidewalk Improvement
- **South Daytona Elementary School, South Daytona**
 - Big Tree Road Sidewalk (Will be submitted for SRTS funding by West Volusia County Community Traffic Safety Team (CTST) in March, 2007)
 - Garfield Drive Sidewalk
 - Magnolia Avenue Sidewalk
- **Spruce Creek Elementary School, Port Orange**
 - Spruce Creek Road Sidewalk
- **Sunrise Elementary School, Deltona** (no recommended projects)
- **Woodward Avenue Elementary School, unincorporated Volusia County/DeLand.**

- Woodward Avenue Sidewalk
- Roanoke Avenue Trail Improvement
- Beresford Avenue Sidewalks (constrained right of way)

Of the projects listed above, two within the City of Edgewater have received Safe Routes to School funding through FDOT. The Volusia County CTSTs are submitting two additional projects for funding; one in South Daytona and one in unincorporated Volusia County near the DeLeon Springs area. The MPO has also authorized a Feasibility Study for the Blue Lake Bike Path (wide sidewalk) in the DeLand area. Other projects listed above are receiving agency review or may be considered for future funding.

Manatee Cove Elementary School Assessment Report: Findings and Recommendations

This study provides the City of Orange City, Florida and other agencies with guidelines for improving bicycle and pedestrian safety for students attending Manatee Cove Elementary School. Observations from site visits and coordination with the school principal and City of Orange City resulted in this Assessment Report and the accompanying GIS mapped Bicycle and Pedestrian Master Plan.

Manatee Cove Elementary school opened in 2006, without appropriate sidewalks, connections and bike lanes for bicycle and pedestrian access. Volusia County has made considerable effort to implement sidewalks along Blue Springs Avenue but has been unsuccessful due to right of way limitations and lack of cooperation from adjacent property owners. The conditions along County owned Blue Springs Avenue require immediate modifications to increase safety for bicycle riders and walkers using this roadway for travel.

Because of the urgency of the hazardous situations in the Manatee Cove Elementary School walk zone, Hoke Design recommended in October 2006 that the School District staff review this site for hazardous conditions classification. Their assessment concluded that this situation did not meet hazardous conditions as defined by Florida Statute 1006.23. Until conditions are improved, this study recommends that bus transportation be offered to all students that use Blue Springs Avenue as a travel route.

Other interim measures to consider include:

- the addition of crossing guards on the crest of the hill west of the school entrance to allow for increased visibility
- providing a level walking surface along the south side of the road
- provide curb ramps on both sides of the new entrance drive to encourage students to use the sloped grass area for walking and bicycle riding.

The school's current policy discouraging the use of backpacks further complicates the students' trip to and from school. School officials should evaluate whether in-school safety issues outweigh bicycle or pedestrian safety.

A middle school and a high school are planned adjacent to Manatee Cove Elementary School. The addition of these schools will further increase the need for a connected

system of sidewalks. The City, County and the School District staff need to work closely to create a continuous sidewalk system connecting the schools to one another and to the surrounding neighborhood.

A sidewalk is planned for the east side of Sparkman Avenue in 2007/08 from Ohio Avenue to French Avenue. This sidewalk is just outside of the Manatee Cove walk zone and attendance zone.

Organizations involved in planning or implementing measures to improve safety may want to use the best practices section included in this report as a checklist for review and implementation of appropriate safety improvement measures.

Section 2: Introduction

Introduction

Background

The Volusia County Metropolitan Planning Organization is mandated with developing pedestrian walkways and bicycle transportation facilities that will function as elements of an inter-modal transportation system within the MPO's jurisdictional planning area (see Appendix B). As part of its efforts to develop and expand a network of safe pedestrian and bicycle facilities, the Volusia County MPO has authorized the 2006/2007 Bicycle and Pedestrian School Safety Review Study using Florida Department of Transportation (FDOT) funding.

In 2005, the Volusia County MPO was awarded an FDOT Safety Grant to analyze bicycle and pedestrian safety for ten elementary school sites. The 2006/2007 Study is a continuation of the 2005 study and provides an Implementation Report for each of the ten elementary school sites included in the original Study. Implementation Reports include a Bicycle and Pedestrian Master Plan in GIS map format, specific findings and recommendations and a "Best Practices" section, outlining frequently found safety issues and recommendations. The schools selected for Implementation Reports include the following:

- DeBary Elementary School, DeBary
- Friendship Elementary School, Deltona
- Holly Hill Elementary School, Holly Hill
- Indian River Elementary School, Edgewater
- McInnis Elementary School, unincorporated Volusia County/ DeLeon Springs
- Palm Terrace Elementary School, Daytona Beach
- South Daytona Elementary School, South Daytona
- Spruce Creek Elementary School, Port Orange
- Sunrise Elementary School, Deltona
- Woodward Avenue Elementary School, unincorporated Volusia County/DeLand.

This Report is provides an assessment of bicycle and safety related issues for Manatee Cove Elementary School and the surrounding walk zone area. This school was one of five schools selected for new Assessment Reports. The five schools selected include the following:

- Freedom Elementary School, DeLand
- Manatee Cove Elementary School, Orange City
- Pathways Elementary School, Ormond Beach
- Sugar Mill Elementary School, Port Orange
- Turie T. Small Elementary School, Daytona Beach.

The selection of these five schools was guided by Volusia County School District staff, and based on the schools' low numbers of eligible walkers and higher numbers of students provided courtesy transportation. The Bicycle and Pedestrian Advisory Committee (BPAC) approved this selection of schools for Assessment Reports at their September, 2006 meeting.

To facilitate planning and communication and to increase the potential for the implementation of recommendations, Hoke Design, Inc. exceeded scope requirements by providing a Master Plan for the Manatee Cove Elementary walk zone area. Additionally, the Best Practices section developed for the Implementation Reports has been included as part of this Assessment Report package.

The School Board has created "walk zone" areas around each school, identifying which students live within the State of Florida mandated two mile radius (see Appendix B). This radius is calculated using the distance from students' homes to the school. The walk zone is often reduced to reflect barriers to students walking or riding bicycles to school. Students living within the two mile radius of the school but outside of the designated walk zone are provided with School Board bus transportation.

Transportation costs are reimbursed by the State of Florida if conditions are considered "hazardous". Safety conditions determined to be "unique" are not reimbursed by the State of Florida and become an operational cost to the Volusia County School District. Transportation for unique conditions is referred to as "courtesy transportation".

Barriers to walking within the walk zone are reviewed by the Hazardous and Unique Conditions Committee (School District staff, County staff, etc.) which determines whether a safety issue merits bus transportation. Florida State Statute S.1006.23 outlines the parameters for determining these safety issues, with current criteria for hazardous walking conditions summarized as follows:

- For walkways parallel to the road, conditions are hazardous if:
 - there is not an area at least 4 feet wide adjacent to the road or
 - the surface is not walkable or
 - the road is uncurbed and has a posted speed limit of 55 miles per hour, and the walk area is set off from the road by less than 3 feet.

These criteria for walkways parallel to the road do not apply in low traffic residential areas with fewer than 180 vehicles per hour, per direction or if the posted speed limit is 30 miles per hour or less.

- For walkways perpendicular to the road, conditions are hazardous if:
 - traffic volume on the road exceeds the rate of 360 vehicles per hour, per direction and the site is uncontrolled or
 - total traffic volume on the road exceeds 4,000 vehicles per hour through a controlled crossing, without a crossing guard.

If passed, Florida HB 147 would expand these criteria substantially. The proposed bill would:

- lower the speed limit from 55 to 35 for walkways parallel to uncurbed roads
- make the need to cross any road with six or more lanes a hazardous condition
- add the residence of any sexual predators (or sexual offenders whose victims include a minor) along any road which students must walk in order to walk to and from school as a hazardous condition.

These potential changes are likely to greatly increase the number of students living within walk zones offered bus transportation, thus increasing School Board costs. For additional information on hazardous walking conditions, see Appendix B.

Observations from site visits and coordination with the school principal, City of Orange City, School District staff and Volusia County staff resulted in this Assessment Report and the accompanying Bicycle and Pedestrian Master Plan.

Purpose of this Assessment Report

The primary goal of this Assessment Report is to provide recommendations for safe, connected and well-maintained pedestrian and bicycle facilities to encourage students to walk or ride their bicycles to school. A safe walking environment for students who walk or ride bicycles to school benefits students, the School Board and the community.

Student benefits include:

- More choices for transportation
- Increased physical activity and health
- Improved mental health and attitude
- Opportunities to learn bicycle and pedestrian safety
- Increased independence
- Safety in numbers; the more children that walk or ride together, the more visible they are to traffic and the less approachable they are to those who might wish to cause them harm.

Community benefits include:

- Reduced road trips
- Reduced cost of bus transportation
- Reduced car drop off and pick up lines at school, decreasing school area congestion
- Increased community cohesiveness and livability
- Better facilities for all residents, including persons with disabilities, the elderly, those without cars, and those who choose alternative transportation for exercise or to improve their lives and the environment
- Increased use of facilities increases visibility and motorist awareness.

The reasons some students within walk zones choose not to walk or ride bicycles to and from school may include:

- Parents' concerns about potential problems with sexual predators, bullies or lack of adult supervision

- Parents' assessment that their children are unable to observe proper bicycle or pedestrian rules, and are unable to make safe decisions when crossing traffic or facing similar motorist conflicts.
- Parents who drop children off at school on the way to work value the convenience and extra time with their children
- Many students stay at the school site for aftercare or take a bus to a local daycare provider
- Some students may convince their parents that the only "cool" mode of transportation is Mom or Dad's car.

Although these factors play a role in the number of students participating in walking or bicycle riding as transportation, this Study emphasizes improvements to the physical environment and provides recommendations for removing physical deterrents to students walking or riding bicycles to school. These physical deterrents may include:

- Lack of a safe, continuous system of sidewalks between home and school
- Long distances to school - most parents do not expect their children to walk or ride two miles to school, especially with heavy backpacks.
- Road crossings without crossing guards
- Railroad crossings
- Multiple conflict points with motorists.

To provide local agencies with a starting point for planning an expanded sidewalk and trail system, and for ease of communication during interagency coordination, this Assessment Report includes a Master Plan.

The Master Plan provides the locations of the walk zone and areas where students are provided bus transportation due to hazardous or unique conditions. Existing and planned sidewalk and trail facilities were determined by site visits, discussions with City and County staff and existing mapping information. The Master Plan also provides proposed sidewalk facilities, trails and other recommended improvements. The Master Plan and supplemental Assessment Report provide guidelines for sidewalk and trail planning and should not be used as an engineering document.

A secondary goal of this report is to encourage planning efforts that include analysis of long term cost tradeoffs related to bicycle and pedestrian safety. While safety is the primary concern, the lack of safe routes to school has a financial impact as well.

A financial cost/benefit analysis related to bicycle and pedestrian safety should be included in early planning efforts for all facility improvement and development projects. This will require further interagency coordination, but may be more cost-effective overall and in the long run.

Some examples of cost/benefit tradeoffs and considerations are:

- Smaller neighborhood schools cost more per student to operate and construct, but would increase the percentage of walkers, thereby reducing school district transportation costs but increasing school operational costs.

- Larger roadways may be more efficient for vehicular traffic, but also may create barriers to bicycle and pedestrian traffic. This may increase school system courtesy transportation costs and sheriff's department crossing guard costs.
- Planning, engineering and construction costs for a mile-long 5' wide sidewalk are approximately \$400,000. This one-time cost may be offset by the following ongoing costs:
 - Volusia County School Board - bus transportation for students unable to walk/ride bicycles to school due to "unique conditions" is \$586/student/year, costing the School Board \$322,866 in 2006/2007.
 - Volusia County School Board - additional pay to teachers who assist with morning and afternoon safety is approximately \$1300/teacher/year
 - Volusia County Sheriff's Office - one crossing guard, with partial benefits, costs approximately \$10,000/year
 - The Volusia County Sheriff's Office and many of the cities also provide a traffic policeman to direct morning and afternoon traffic at the school. Many of these officers simultaneously direct students across school entranceways.

Consideration of long-term safety-related financial impacts, careful interagency coordination continued safety education and enforcement are all required to maximize bicycle and pedestrian safety while minimizing overall costs.

A third goal of this report is to provide general understanding of costs associated with constructing sidewalks. Although there is not enough funding available for implementation of most of the sidewalks recommended in the Master Plan, there are some funding sources available.

With the recent passage of the "Safe Routes to School" program, one potential source of funding is the federal funds the State of Florida will receive annually for five years to make it safer for children to walk or bicycle to school (see Appendix D).

Estimates from the Federal Highway Administration of funding for the FDOT District 5 area are as follows:

2007 -- \$1.5 million (with money rolled over from 2006)
2008 -- \$1.3 million
2009 -- \$1.6 million
2010 -- \$1.6 million
2011 -- \$1.7 million.

The FDOT State Safety Office anticipates that one "Safe Routes to School" project will be programmed within Volusia County every other year. Efforts to procure funding under this program have already been successful. As part of this Study, the Volusia County MPO submitted several projects for Safe Routes to Schools funding consideration. Two projects in the City of Edgewater, totaling an estimated \$420,000, were combined and approved for funding through this program.

This report includes information that may be critical for successful funding through state or federal programs. Please note that the Florida Department of Transportation requires agencies to follow federal guidelines for right of way acquisition and requires certification of right of way prior to project funding (see Appendix E).

Report Overview

This study provides the City of Orange City and Volusia County, Florida and other agencies with guidelines for improving bicycle and pedestrian safety for students attending Manatee Cove Elementary School.

Section 1 is an Executive Summary of this Assessment Report, and Section 2 provides an Introduction.

Section 3 contains a summary of specific findings and recommendations for the school's walk zone.

Section 4 details "best practices" for facility planning and coordination, modifications and maintenance of existing facilities, and interim measures. Organizations involved in planning or implementing measures to improve safety may want to use this section as a checklist for review and implementation of appropriate best practices.

In Section 5, the Bicycle and Pedestrian Master Plan emphasizes critical sidewalk or trail plans recommended for further development, adoption and implementation in the City of Orange City or Volusia County. The Master Plan will assist the City/County with prioritization of projects and can serve as a guide for inclusion of priority projects in other public works or private development projects.

Section 3: Findings and Recommendations

Findings and Recommendations

Manatee Cove Elementary School – Fact Sheet

- **Number of Students:** 765
- **Number of Walkers/Bicycle Riders (estimated from Principal survey):** 111
- **Number of Bicycle and Pedestrian Crash Events (2000-2004):** Not applicable, new school 2006
- **Number of School Buses:** 5
- **Number of Aftercare Buses/Vans:** 9
- **Number Bicycles:** 12
- **Number of Bicycle Helmets:** 7 (with the bikes)
- **Teachers Assisting in Arrival and Dismissal Safety:** 8

Existing Safety Education: The 5th grade class has a safety patrol program. The school has given detentions for students not wearing helmet and has provided helmets to students.

Summary of Principal Comments:

- Blue Springs Ave. and Sparkman should be a four-way stop and the intersection of the school entrance onto Blue Springs Avenue should be a three-way stop.
- The proposed school fencing, depending on location, may decrease parent overflow parking and result in a longer car line at arrival and dismissal time.
- The proposed fence may reduce the number of parents using the bus drop off area for temporary parking. The use of this area creates a safety issue when parents and students cross between the buses.

Summary of Crossing Guard Supervisor Comments:

- Blue Springs Avenue is a hazardous situation, children riding against traffic on roadway.
- Need roadside flashers, traffic is busy and goes too fast
- “Early – early” release days have a “trickle down” effect and creates confusion with parents, crossing guards and motorists.

Crossing Guard Locations:

- Entrance road to school and Blue Springs Ave.
- Entrance road on school grounds at parent drop off entrance
- Ohio Avenue and Sparkman Avenue South
- Blue Springs Avenue and Sparkman Avenue (Planned Spring 2007)

Findings and Recommendations

Off-campus

Issue: The biggest safety issue facing students as they walk or ride their bicycles to Manatee Cove Elementary School is the lack of pedestrian or bicycle facilities on Blue Springs Avenue. Blue Springs Avenue is the primary route for the existing walk zone and currently serves an average of 19 students, mostly bicyclists. The roadway is curbed near the intersection of the school entrance drive, with no bicycle lanes or shoulders and has steep grades along the right-of-way, forcing students to walk their bicycles or ride in the narrow roadway with traffic. Blue Springs Avenue in this section is owned and maintained by Volusia County.

Each issue that contributes to this overall safety problem is described in detail below.

Issue 1: The sidewalk along the School Board's access road ends with a curb and no ramp. The crosswalk that crosses Blue Springs Avenue also does not have a ramp to it and does not terminate in a level area on the north side of Blue Springs Avenue.

The new crosswalk at the school entrance road ends in a raised curb (missing ramp)

The crosswalk across Blue Springs Avenue leads to a constrained right of way with utilities. The curb ramp is also missing.

Issue 2: Students heading west from the school entrance road onto Blue Springs Avenue ride in the roadway against traffic. The grass area is too steep and sandy to accommodate bicyclists. The children observed in the field followed the rules and walked their bicycles through the crosswalk area. They then either mounted their bicycles when they reached the roadway and swerved into the road as they started to pedal or they walked their bikes toward the crest of the hill and then rode into the roadway off of the curb. Shade and shadows, along with the hilly terrain in this

Students ride against traffic along Blue Springs Avenue

area, make it difficult for motorists to see students.

Recommendations: Provide bus transportation for students using this route until a sidewalk is constructed along the south side of Blue Springs Avenue. Alternatively, provide an additional crossing guard to stop traffic along Blue Springs Avenue until students are beyond the crest of the hill. This would address limited motorist sight distance at this intersection.

Volusia County has made great efforts to resolve right of way issues to provide for the construction of a sidewalk. The County is continuing these efforts and plans to construct sidewalk where right of way permits. The implementation of the sidewalk may require some sections of retaining wall to provide a level area. The retaining wall should be constructed so that children cannot ride their bikes on or over it.

Many students, especially those living near the school, will choose to walk or ride their bicycles to school if offered public transportation. Interim safety measures should be provided to accommodate these students. These include:

- Grade a level walking surface, minimum 4' wide and add crushed shell or other surface until a sidewalk can be installed. A grass surface is preferred to a sandy surface
- Add flashing lights visible to motorists before they reach the crest of the hill and place the cone so that it is visible for east bound motorists
- Add crossing guards at the crest of the hill to allow the children to use the roadway until they can be easily viewed by motorists
- Advise students to walk their bicycles along the grass until they can be seen by motorists and place signs telling them where to dismount and mount
- Enforce bicycle helmet use
- Distribute and encourage the use of flashing lights for bicyclists.
- Provide ramps in the sidewalk system
- Research staggering the time of walkers/ bike riders to avoid peak parent pick-up and dismissal traffic.

A student veers into the roadway as he begins to pedal uphill.

The student shown in the above photograph continues up the hill on Blue Springs Avenue

Since construction of a sidewalk along the south side of Blue Springs Avenue may not be immediate, the School District staff, Volusia County and the City of Orange City should work to construct an alternative wide sidewalk/trail along the north side of School Board property and WESH-TV property connecting Buford Avenue with the entrance roadway to Manatee Cove Elementary School. This sidewalk should be

incorporated into the Middle School development plans and connect to the proposed high school south of the elementary school. See the enclosed Master Plan for location details.

Issue 3: Some students ride their bicycles westward along the south side of Blue Springs Avenue and cross Blue Springs Avenue without a guard.

Recommendation: Provide a crossing guard at Buford Avenue and Blue Springs Avenue.

Issue: There are no sidewalks along Sparkman Avenue South and students will be expected to walk along the roadway to the crossing guard location at Sparkman Avenue and Blue Springs Avenue.

Recommendation: Provide a sidewalk (preferably 6' wide), along the west side of Sparkman Avenue from French Avenue to Blue Springs Avenue. A sidewalk on the east side of Sparkman Avenue is funded for construction in 2007/08.

Sidewalks are planned for the east side of Sparkman Avenue but are still needed on the west side to serve Manatee Cove Elementary School

Issue: A middle school and high school are planned for this area and will greatly increase the number of pedestrians and bicyclists.

Recommendation: The School District staff, Volusia County, the City of Orange City and the developer of Sparkman Ridge should continue to work together to provide a safe, connected sidewalk system for this area.

On Campus

Issue: Although this school is new, there are no pedestrian connections from the bus parking or parent parking lots to a designated crosswalk and ramp to the school.

Recommendations: The existing curbed islands within the parking lot should be redesigned to provide ramps and a continuous, logical crosswalk should be painted to connect to the existing ramps on the sidewalk adjacent to the school building.

Curbed areas in the parking lot do not have access ramps

Issue: The school site currently provides substantial overflow parking on a grass area beyond the bus loop and staff parking areas. This creates a flow of parents who approach the school through the bus loading and drop off area causing conflict with bus operations and creating a safety concern. According to the assistant principal, the school is planning to fence the bus loading and drop-off area soon to prevent this practice.

Overflow parking exists along a school entrance roadway

Recommendations: The School District staff should carefully review the placement of the fence to allow some overflow parking along the entrance drive and provide additional room for a wide sidewalk beyond the car area. A sidewalk system should fully connect all access points of the school to all designated and overflow parking areas.

A student and their parent cross behind a bus to access their vehicle in the overflow parking area

Issue: The school site does not have a complete network of sidewalks on campus.

Recommendations: The School Board should construct complete sidewalks along both sides of the entrance drive, set back to allow temporary overflow parking off of the driveway.

A student walks along the side of the internal entrance road leading to Ohio Avenue

Issue: The entrance road on school property has a sidewalk that crosses the intersection of the parent entrance and it is placed too far from the intersection. A stop sign has been shifted to accommodate the crossing and a yield sign has been added.

Recommendation: The school district staff should review this conflict area and consider straightening the existing sidewalk to cross at the actual intersection. The stop sign and stop bar should be relocated to reflect this change and the yield sign should be removed.

The crosswalk is located away from the intersection. Note the yield sign located at the intersection beyond the stop sign

Issue: This sidewalk is too narrow to accommodate pedestrians, strollers and bicyclists simultaneously and the route of the sidewalk is not direct, causing many students and parents to cross over the grass area instead.

Recommendation: When funding is available, replace the sidewalk with a wider sidewalk that follows the path most frequently used by pedestrians and bicyclists by observing behaviors or noting the worn areas in the grass.

Students bypass the sidewalk to take the most direct route to the guard

Issue: The entrance road to the school has a sidewalk on only one side and it is too narrow to accommodate bicyclists and pedestrians simultaneously.

Recommendation: The School Board is planning to provide a sidewalk along the west side of the entrance road. If possible, the sidewalk should be 8' wide. The sidewalk should connect to the future middle and high school.

A sidewalk for the west side of the entrance road is planned by the School Board

Section 4: Best Practices

Best Practices

This section contains a set of best practices to improve bicycle and pedestrian safety for students. The best practices are applicable to any school walk zone. Observations made during site visits showed an inconsistent use of these practices across school walk zone areas. Organizations involved in planning or implementing measures to improve safety may want to use this section as a checklist for review and implementation of appropriate best practices. Any recommendations made in this report that involves traffic movement or control should be reviewed by an engineer to determine engineering recommendations for that specific situation.

These best practices are divided into the following sections:

- **Agency and Project Coordination**
- **Sidewalk Design –
Recommendations for New Roadways and Developments**
- **Retro-fit Development –
Adding Sidewalks to the Built Environment**
- **Improving Existing Roadway Conditions**
- **Sidewalk Maintenance**
- **Crosswalk and Lane Markings**
- **Signals**
- **School Board Considerations**
- **Enforcement and Education**

A general best practice for all agencies, organizations and situations is to conduct public workshops to better understand the needs and desires of residents and to gain project support. Consider revising and adopting the Bicycle and Pedestrian Master Plans for walk zones according to input from these workshops.

Agency and Project Coordination

Findings

Interagency and intra-agency coordination on bicycle and pedestrian safety issues for school walk zones is inconsistent across jurisdictions and projects in Volusia County. Improved coordination could:

- Build consensus on measures to improve safety;
- Highlight and minimize conflicting plans, policies and procedures; and
- Facilitate overall best use of funding by combining projects

South Daytona Elementary:
New street trees in walk area

(e.g. combining safety projects with stormwater projects).

For instance, the right of way area most suitable for sidewalk placement may also be the best location for street lighting, street trees or landscaping. Local governments should consider the existing usage of the right of way by pedestrians and allow for future sidewalk construction.

Best Practices

- Consider coordination meetings once or twice a year to plan and coordinate bicycle and pedestrian safety improvement projects. Meeting agendas should include improvements involving modification of policies or procedures, in addition to those involving funding and construction. These meetings will allow agencies and stakeholders to communicate concerns, discuss upcoming projects and coordinate public works efforts, planned development and school development plans. Key decision makers will also be reminded to consider existing or future pedestrian facilities while planning unrelated projects.
- Coordination meetings typically include the following departments or organizations:

Coordination Meeting: Volusia County MPOs', Stephan Harris with City of Daytona Beach Staff

- ♦ City Manager or Assistant Manager
- ♦ City/County Public Works (roads, stormwater) staff
- ♦ City/County Engineering staff
- ♦ City/County Planning/DRC staff
- ♦ City/County Parks and Recreation staff
- ♦ City/County Police or Sheriff staff
- ♦ School Principal and School District staff (if applicable)
- ♦ Volusia County MPO Bicycle and Pedestrian Coordinator
- ♦ Crossing Guard Supervisor
- ♦ Votran staff
- ♦ Developer (if applicable)
- ♦ County staff (if the area involves unincorporated County or County-maintained roadways)

- In addition to the regular coordination meetings discussed above, coordinate bicycle and pedestrian facility plans on an ongoing basis among FDOT, the Volusia County MPO, Volusia County Engineering and Leisure Services, the Volusia County School District staff and adjacent municipalities to increase efficiency, communication and regional efforts. Coordinate with the State Office of Greenways and Trails for trail development. Provide and maintain information using Geographical Information Systems (GIS)

Palm Terrace Elementary Vicinity:
Votran users with no sidewalk access

whenever possible. Provide GIS data to Volusia County.

- Votran serves some students and school staff and should be integrated into the sidewalk system. Provide Votran bus stop locations with waiting and accessory pads to improve accessibility for persons with disabilities and to increase user safety and comfort. Conflicts between bicycle and pedestrian traffic and Votran onloading and offloading should be minimized to maintain through traffic on sidewalks. Votran routes should be considered when prioritizing sidewalk construction projects (see Appendix G for details).

The Bicycle and Pedestrian Master Plan provided with this Report is meant as a starting point for continued coordination and prioritization. The Master Plan should be used as a working document, evolving as opportunities for coordinated efforts develop.

The Bicycle and Pedestrian Master Plan should be periodically reviewed and updated, possibly in conjunction with local comprehensive plans or local ordinances.

Sidewalk Design – Recommendations for New Roadways and Developments

Findings

Sidewalk planning efforts for new roadways and developments are inconsistent across jurisdictions and walk zones. Planning efforts do not always result in the best possible bicycle and pedestrian routes to schools.

New sidewalks do not always meet current ADA guidelines or requirements.

In many recent developments, the local agency has required a turn lane without obtaining additional right of way from the developer. The addition of a turn lane in the right of way reduces the available area for sidewalks, sidewalk buffer and bicycle lanes. Sometimes this practice has made the sidewalk in this section less usable and also made future continuous sidewalks difficult to construct.

Orange Camp Road: Turn lane narrows available right of way

Sidewalks with sharp angles are difficult for bicyclists

Best Practices

- Provide pedestrian and bicycle connectivity, safety and ADA compliance training for staff who review proposed school, roadway or new development plans. Train field staff who construct or repair sidewalks.
- Require sidewalks on both sides of the roadway for all new development.
- Separate the sidewalk from the roadway as much as possible, especially on roadways without curbing.
- Create sidewalk facilities to accommodate bicycle use. Students (and their parents if students are escorted) riding bicycles frequently use sidewalks. To address multi-function use, the sidewalk should be as wide as possible (8' preferred), without any sudden changes in direction. Obstacles such as encroaching landscaping, guy wires and power poles should be eliminated or avoided.
- Require all private, public or church properties to construct sidewalk along the property perimeter.
- When the boundary of a development is next to school property, require the developer to locate common areas or amenities (ponds, parks, etc.) immediately adjacent to the school. Require the developer to build and integrate sidewalks

into these common areas. Require pedestrian interconnectivity between neighborhoods. Do not allow exceptions for sidewalk construction within developments at retention ponds, parks or public areas.

To increase connectivity among neighborhoods and schools, developers should be required to construct sidewalk systems and connections to adjacent communities and schools before lots are sold. This eliminates gaps in the sidewalk system and ensures that buyers are aware of intended connections adjacent to their properties. Multiple connections are preferred. This should reduce the likelihood of parents using any one connection as a major student drop off area to avoid the car line.

Pathways Elementary: Sidewalk connection to school from adjacent neighborhood

Freedom Elementary Vicinity: Sidewalk connection between housing developments at Victoria Park

- Consider adopting sidewalk corridor design guidelines describing sidewalk width, placement of street furniture, placement of signage and landscaping and other guidelines to increase pedestrian comfort, convenience and safety.
- Consider adding language to Development Orders to allow the local agency to review site plans for additional requirements if the project has not been constructed within five years. This provides for opportunities to connect to new or future schools, neighborhoods, roadways or other development that occurred after the initial Development Order was approved.
- Require developers to dedicate right of way to match the width of the loss of the turn lane and require them to construct bike lanes, sidewalks and crosswalks.
- Encourage developers to design site plans to provide the most direct sidewalk/trail route to the surrounding schools. Sidewalks with the fewest number of street crossings are preferred.

Retro-fit Development – Adding Sidewalks to the Built Environment

Findings

Most walk zones include sections of roadways with no sidewalks on either side of the street. Often, this is not a problem if the road is located in a residential neighborhood with little traffic and low vehicle speeds.

However, there are some roadways with high traffic volumes and no sidewalks that provide the only viable route to and from school.

Some streets have a sidewalk on one side only, which encourages students to cross roadways at random points to reach the sidewalk on the opposite side of the street. This also causes students riding bicycles on the sidewalk to ride against traffic during one of their trips to or from school.

Sidewalks located on alternating sides (switching back and forth across the roadway) present a significant safety issue by encouraging students to cross the roadway more than one time to reach their destination.

The primary obstacles to retrofitting sidewalks within walk zones are:

- Lack of right of way

Manatee Cove Elementary Vicinity:
Student rides against traffic in roadway along Blue Springs Avenue

Holly Hill Elementary:
Narrow right away along Riverside Drive

- Location of drainage swales or ditches in rights of way

Holly Hill Elementary:
Drainage in right of way along 15th Street

- Steep grade conditions and wetlands

Manatee Cove Elementary:
*Student walks bicycle on steep grade along
Blue Springs Avenue*

- Structures (buildings, bridges, headwalls, etc.)

Indian River Elementary:
*A headwall along 26th Street creates a barrier to
sidewalk construction*

- Right of way encroachments

Holly Hill Elementary Vicinity:
Parking encroaches into road right of way

The following best practices are meant to address these obstacles.

Cities or the County may be able to provide interim measures to improve safety conditions if right of way is limited, funding is unavailable or a situation cannot be addressed. Possible interim measures are listed following the best practices.

Best Practices

- Prioritize projects where roadways with heavy traffic have no sidewalks on either side, then those with sidewalks on alternating sides.
- Local agencies should follow all Federal, State and County requirements for obtaining right of way for projects that may be submitted for Federal funding at a future date. Right of way acquisition can take two years or more and add substantial cost to any project.

Additionally, FDOT is now requiring the maintaining agency to “certify” right of way to reduce the possibility of problems during the development or construction stage (see Appendix E).

Alternatives to acquiring right of way include:

- Narrowing the existing roadway pavement;
- Reducing the number of travel lanes;
- Creating one-way traffic;
- Removing the center turn lane or shifting the roadway bed to one side of the right of way to allow for placement of a sidewalk on the other side; and
- Claiming right of way through surveying and documentation of maintenance maps for four years to establish limits of right of way to record.

The local agency may also be able to obtain easements to construct sidewalk facilities on adjacent property.

In many situations, a ditch or swale is located in the only available right of way, creating undesirable walking or bicycle riding conditions. The maintaining agency should consider developing a drainage master plan that identifies critical pedestrian routes that may be improved by providing culverts along roadways where there is insufficient room to co-locate a ditch and a sidewalk. Combining sidewalk improvements with drainage improvements may cut costs and increase funding options.

If there is sufficient right of way in a situation with steep grade conditions, the area between the edge of the road and the right of way line should be re-graded to provide a level area for sidewalk construction. New sidewalk construction that ties into an existing sidewalk should align smoothly (for bicycle users) and match the grade of the existing sidewalk.

Interim Measures

- Re-grade steep banks to provide a level area as far away from the road as possible.
- Increase roadside maintenance (or enforcement of maintenance) such as mowing and trimming of encroaching landscaping to provide a better surface for pedestrians and bicyclists. Remove newspaper stands, trash receptacles, debris and other movable objects from the path of travel.
- To increase connectivity between neighborhoods and to schools, where easements are not available, consider buying a lot or lots to provide a connection, building the connection and then re-selling the properties. Purchasing a parcel for a connection may pay for itself in a few years if enough students are able to be removed from the school bus system (estimated \$586/student/year).
- Research the possibility of obtaining easements to build sidewalks for routes commonly used as a short cut by students. Review these routes for sexual predators and sexual offenders. Inform parents of potential hazards.

Students take a short cut through private property

Existing Sidewalks That Do Not Meet Current Recommendations

Findings

Many existing sidewalks do not provide optimum conditions for students walking or riding their bicycles to school.

Some sidewalks are adjacent to and flush with the roadway, and this encourages motorists to use the sidewalk as an extension of the roadway. This design reduces the buffer between the motorist and the pedestrian, and decreases safety and comfort for the sidewalk user.

Sidewalk flush with road

In multiple school walk zones throughout Volusia County, motorists park on sidewalks, blocking bicycle and pedestrian traffic and decreasing visibility.

Many sidewalks do not meet current ADA guidelines.

It is difficult to obtain funding for reconstruction of sidewalks; the local agencies will most likely need to absorb the cost to correct these facilities. Relocation or widening of the sidewalk may be possible in many areas where there is sufficient right of way but will be complicated and costly in areas that involve drainage ditches, swales or utilities. The best practices listed below will need to be implemented as funding and right of way allow.

Sidewalk abuts roadway

Best Practices

- Sidewalks that were constructed adjacent to the roadway and flush to the roadway pavement should be replaced.
- Sidewalks should be modified or replaced to meet current ADA guidelines. This includes:
 - ♦ A minimum of a five foot wide sidewalk when there is a five foot separation from the roadway.
 - ♦ Curbed sidewalks adjacent to the roadway should be a minimum of six feet wide (from back of curb).
 - ♦ Truncated domes should be placed at curb ramps to crosswalks or where the sidewalk terminates into a roadway or entrance drive.

- ♦ A four foot clearance from all obstacles should be provided.
- Regardless of separation from the roadway, a minimum width of eight feet is preferred to properly serve students walking or riding their bicycles, especially within one mile of the school.
- Local agencies may wish to “bundle” similar projects to reduce costs and to increase the potential number of construction bids. Projects may also be combined or divided further to meet grant application requirements.
- Local agencies may wish to distribute sidewalk funds among several less expensive projects that would have a greater overall impact on an area’s accessibility, instead of consuming all allotted funds on one ideal but very expensive sidewalk improvement.
- Motorists who park on sidewalks in school walk zones should be warned and/or ticketed, especially during the first two weeks of the school year.

Interim Measures

- Where sidewalks are adjacent to and/or flush with roadways, mark the outside lane to provide a buffer between the sidewalk area and the roadway, and to provide a paved area for bicyclists.
- For critical conflict areas, consider adding flexible bollards to mark the edge of pavement to direct motorists away from the sidewalk. These bollards are not attractive and often need to be replaced frequently when damaged by vehicles.
- If the sidewalk is adjacent to the roadway because the area was filled in to reduce maintenance, consider removing the infill asphalt and replacing it with sod.

Improving Existing Roadway Conditions

Findings

Roadway design in school walk zones does not always maximize bicycle and pedestrian safety. Vehicles travel at high speeds, sidewalks and bike lanes are narrow or non-existent and cars pulling out from parking areas endanger bicyclists and pedestrians.

Some land uses, especially older developments, were constructed to include the road right of way as part of their parking. Vehicles often park in the “walk area” and create conflict with pedestrians and bicyclists. In addition, some businesses use the public right of way as storage or for display signs.

Back-out parking crosses walk area

Cars park on undefined trail along Big Tree Road

Best Practices

- Provide traffic calming measures near schools to reduce speeds and encourage bicycle use and improve walking conditions. Where possible, consider reducing traffic lane width to provide for designated bike lanes or shoulders.
- According to recent studies, four lane roadways with fewer than 14,000 ADT's (Average Daily Traffic) can be reduced to a two lane road with wider sidewalks and bike lanes without significantly reducing traffic efficiency.
- Roadways that are converted from two-way to one-way traffic can usually accommodate the addition of bike lanes and wider sidewalks and may accommodate parallel parking or landscaping.
- If shoulders are used as sidewalks and there are no sidewalks, ADA conditions must be met.
- Work with businesses to eliminate back out parking along streets. Do not allow private use on public right of way, such as parking, storage, displays, temporary signs, etc.
- Where parallel parking is used, provide curb bulb outs to define pedestrian areas and decrease crosswalk distances.

Sidewalk Maintenance

Finding

Sidewalks require ongoing maintenance to keep up surface quality, reduce trip hazards, and stay current with ADA standards and recommendations. Sidewalks in some of the school walk zones studied are in poor condition and/or don't meet current ADA standards. Maintenance projects are typically funded by the local agency.

Buffer area paved with asphalt

Crumbling sidewalk

Best Practices

- A review of sidewalks within the walk zone should take place each year to determine if safety hazards are present. Maintenance and safety hazards that are identified in a review of sidewalks should be addressed immediately.
- Local agencies may wish to set up a maintenance program for sidewalks that has a set budget amount each year.

Crosswalk and Lane Markings

Findings

Crosswalk markings and outside lane markings are faded or missing in many school walk zones reviewed in this Study. Clearly defined crosswalks increase motorist's awareness of pedestrians and provide school children with a designated area for crossing. Clearly marked outside lanes define the roadway edge for motorists and increase the distance between the moving vehicle and the sidewalk user.

Crossing guards are not provided for all crosswalks on heavily traveled roadways in walk zones.

Some commercial sites have undefined vehicular access points. Wide expanses of asphalt or concrete increase the exposure of pedestrians and bicyclist using these areas as part of their routes to school.

Diagonal Crosswalk connects alternating sidewalks

Single ramp places pedestrians crossing closer to traffic along 17-92

Best Practices

- Use "ladder" style crosswalks with thermoplastic paint to increase crosswalk visibility for the motorist and the pedestrian. Consider adding green fluorescent paint to crosswalks where crossing guards are located.
- Provide illumination at crosswalks when lighting conditions are poor. (The number of days students will arrive in the dark will increase in 2007 due to changes in daylight savings time.)
- Provide crosswalks that align with the sidewalk layout to increase convenience and encourage proper use.
- Provide the shortest crosswalk possible to limit exposure time in the crossing.

- Align sidewalk ramps with the crosswalk and widen to match crosswalk width. If the sidewalk is less than 8' wide, center the sidewalk and ramp with the crosswalk.
- Implement the most recent guidelines for crosswalk signage and placement.
- If the crosswalk crosses a middle turn lane or median, provide a raised median with flush access through the median to provide a refuge area.
- Use an "advance yield line" before crosswalks to increase motorists distance from the crosswalk. Provide signage for this line and additional signage for the crosswalk location.
- Paint outside lane markings to allow for the widest shoulder possible to provide for bicyclists. The maximum width for the outside travel lane should be twelve feet.
- Increase the frequency of painting road markings to better define roadway shoulders, edge of pavement and crosswalks.
- Local agencies may wish to remove the crosswalks that encourage students to cross in areas where traffic is heavy and no crossing guard can be provided.
- Provide painted crosswalks over access driveways for subdivisions, commercial and industrial sites, and schools. With new construction or when retro-fitting, provide sidewalk material (typically concrete) through access drives to emphasize the sidewalk.

Recommended crossing detail

Signals

Finding

Signal design is inconsistent across school walk zones, and does not always maximize bicycle and pedestrian safety.

Students sometimes cross an intersection that has a pedestrian signal but no crossing guard.

Some pedestrian signal buttons are not accessible to all users. Some signals are also placed incorrectly and there is confusion as to which street or section of street the button controls.

Many agencies are updating their pedestrian signals to the “count down” type of pedestrian signal. Students using crosswalks with this type of signal may be less able to determine when it is safe to cross. Many elementary aged children can not estimate the number of seconds that it will take to cross or finish crossing a roadway.

One proposed crossing requires students to cross one direction of traffic and then another direction of traffic in two separate cycles. The “walk” signals are aligned directly across the roadway and may confuse the user of the crosswalk.

Access to pedestrian push button is not paved

Push button is located away from the walkway

Best Practices

- When pedestrian signals are present, provide accessible buttons with arrows indicating direction of crossing. Consider specifying push buttons that light up when activated. Consider painting arrows on the sidewalk to further clarify the direction of crossing in relation to the push button.
- For the first two weeks of the school year, observe potentially dangerous crossings that do not have a crossing guard. If children use these crossings, redirect them to a crossing where a guard is located.
- Educate students on pedestrian signals, including count down signals. Provide signs near the buttons with picture diagrams. Determine elementary aged students' ability to understand and use count down pedestrian signals before installing them in walk zone areas.
- Consider providing protected walk phases at intersections with student crossings to prevent conflict with right and left turning movements. Providing a protected left turn can substantially reduce crashes involving pedestrians.
- Provide the longest possible walk phase to accommodate children's needs.
- Consider prohibiting "right turn on red" and/or U-turns at intersections with students crossing.
- Provide a paved area to the pole where the push button is located. Locate the push button nearest to the corresponding curb ramp.
- Provide transportation to students who must cross wide, busy roadways in two separate cycles to get across. Research possible attendance rezoning that would allow these children to walk to a different school. Consider applying for grants to provide an overhead walkway to span the roadway. Research the possibility of relocating the crossing away from the intersection to reduce turning movement conflicts. Consider extending the time that guards are located at this type of intersection to reduce the possibility of a late arriving student crossing unaided.

School Board Considerations

Findings

Some attendance zone layouts discourage walking to school. Some schools have neighborhoods next to their property that are zoned for other, more distant schools.

Not all schools are located in dense or fairly dense residential areas, reducing the potential number of students eligible to walk or ride their bicycles to school. The two mile radius walk limits determined by the State of Florida are often unrealistic for elementary age children. If there are several roadway crossings or if the walk/ride is stressful, many parents will drive their children to school.

School policies regarding backpack use, bicycle use, configuration of drop-off areas, etc. are typically set by the principal at each school, and may negatively affect the number of children walking or biking to school. Specific considerations include:

- Banning backpacks means students have to juggle books, papers, lunch boxes, jackets, etc., while riding bikes or walking up to two miles.
- Banning rolling backpacks means that students often carry backpacks weighing in excess of 10 pounds. This could discourage elementary students from riding bikes or walking up to two miles to school.
- At least one school does not allow students to ride bicycles to school because of bicycle theft problems. Students who could easily ride a bicycle to school may find the distance too long to walk.

Backpacks are not allowed for some students

Many schools were and are still designed with only one sidewalk connecting to the main area of campus. This typically means that students must cross a car line entrance or a bus entrance to reach the school. Many of these entrances are staffed by teachers (supplementals) who are paid to cross students safely.

Many school parking areas continue to be designed without connected sidewalks, crosswalks and ramps. Many crosswalks that terminate in a raised sidewalk provide an accessible ramp only on one end of the sidewalk, making travel difficult for those with strollers, wheeled carts or backpacks, bicyclists and persons using wheelchairs or walkers.

Best Practices

- Create attendance zones that encourage walking or bicycle riding to school.

- When locating future schools, work with the local agency to analyze existing pedestrian and bicycle facilities. Plan a logical network of sidewalks and prioritize for funding. Provide interim measures for critical walking/bicycling routes that will be without sidewalks when the school is opened (see interim measures under Retrofit Development and Crosswalk and Lane Markings sections).
- School site plans should be designed and reviewed in the context of the area in which they will be located. Planning should include sidewalk connectivity for at least ¼ mile out or to logical points in the existing environment. For example, a sidewalk may be difficult to add to a nearby roadway (often due to lack of right of way), but it may be possible to include an alternative route for a sidewalk on school property. In addition, it may be cost-effective to purchase a vacant lot to provide a neighborhood connection to a school if this removes courtesy busing for a substantial number of students.
- School site plans should balance security with school access. Multiple pedestrian/bicycle entrance points to a school campus decrease the travel distance for many students and may increase the number of walkers and bicycle riders. Some principals prefer to allow only one access point to reduce supervision requirements.
- The School Board should consider whether to institute uniform, system-wide policies that will encourage students to walk or ride bicycles to school. Any school-wide policy decisions must be weighed against the benefits of the specific knowledge and judgment an individual principal brings to each school's bicycle, pedestrian and general safety situation.
- The School Board, in partnership with Volusia County, FDOT and the Volusia County MPO, should develop uniform criteria for determining when school safety staff is needed, when a crossing guard is needed and when courtesy transportation should be provided.
- Consider a school-wide policy on allowing rolling backpacks to encourage walking and reduce the weight students must carry to and from school. Alternatively, provide students who walk or ride their bicycles with a second set of text books for home.
- The School District staff should analyze whether additional sidewalks on the campus will reduce or eliminate the need for students to cross school entranceways.
- The School District staff should review site plans for clearly defined accessible pedestrian routes from the points of entry to the school sidewalk system. Sidewalks should be provided from parking areas to the school sidewalk system. Locate sidewalks to provide the most direct route from the external sidewalk system to the typical point of entry or entrances. Locate the sidewalk away from the access drive when possible.
- The School Board should implement a district-wide policy requiring the use of bicycle helmets on all school campuses.

- The School Board should require every school to participate in bicycle and pedestrian safety events such as the International Walk to School Day.
- The School Board and Sheriff's Office should require school-based law enforcement officers (School Resource Officers) to enforce violations of bicycle and pedestrian laws on and around school grounds (School Resource Officers work for the sheriff's department and their responsibilities are assigned by the Volusia County Sheriff's Office).
- The School Board should require all teachers assisting students with crossing vehicular traffic to wear green or orange safety vests.

Enforcement and Education

Findings

Some schools have few students who walk to school even though the sidewalk facilities are adequate.

Many agencies that provide traffic assistance and enforcement for the elementary schools do not have an active bicycle police unit.

Many local agencies do not notice obstacles blocking sidewalks or ticket motorists who park on sidewalks.

Students are sometimes slow to adapt to changes in sidewalks, crosswalks or crossing guard locations.

Despite current bicycle helmet laws and helmet give-away and education programs, many students ride their bicycles without helmets.

Sign blocks sidewalk near Freedom Elementary

A parent creates a personal parking space

Students without helmets near Manatee Cove Elementary

Best Practices

- The schools with few students participating in walking or bicycle riding to school may wish to implement an incentive program to encourage more students to use non-vehicular transportation to school. The school and volunteers could assist with the following planning efforts or incentives:
 - ♦ "Walking school bus" planning or pairing students for walking/riding
 - ♦ Providing parents with a sidewalk map
 - ♦ Bicycle or bicycle helmet giveaways
 - ♦ Bicycle gear, stickers or reflective bands as rewards
 - ♦ Second set of text books for home
 - ♦ Rolling backpacks

- Consider delivering flyers to parents in neighborhoods near the school stating the benefits of walking/riding to and from school and asking for volunteers to act as chaperones.
- Consider starting/expanding the duties of bicycle police units to include monitoring the safety of the routes to schools for students who ride their bicycles or walk to and from school. Bicycle police can also assist with safety training and provide recommendations for safety improvements through "hands-on" experience.
- Crossing guard supervisors and schools should consider awareness campaigns after any changes in routes to schools. In addition to flyers and in-school presentations, this may require crossing guards to re-direct students for a two week period immediately after any changes are made, and sporadic efforts afterwards. Consider rewarding students who use new sidewalks, crosswalks or routes.
- Consider tougher enforcement on helmet wearing. Crossing guards should continue their efforts to increase bicycle helmet use and give warnings to the students the first week of school and thereafter give student names to the school for them to send a note home to parents. See the 2005 Bicycle and Pedestrian School Safety Study for further discussion and ideas.

Section 5 – Bicycle and Pedestrian Master Plan

Bicycle and Pedestrian Master Plan

The following Bicycle and Pedestrian Master Plan specifies a network of sidewalks and trails that, if implemented, will greatly increase the convenience and safety of travel for pedestrians and bicyclists. The Bicycle and Pedestrian Master Plan includes the following information:

Existing Conditions:

- Walk zone area (shaded pink) (RGB= 255, 204, 204)
- Courtesy Transportation zone (shaded blue)
- Existing Trails (solid green line, source: field review and aerial photographs) (RGB= 11, 81, 11)
- Existing Wide Sidewalk 6-8' (solid blue line, source: field review) (RGB=0, 51, 204)
- Existing Sidewalks 3-5' (solid red line, source: field review) (RGB=210,0,0)
- Existing Crossing Guard Locations (green ring, source: crossing guard supervisors, 2005 and 2006)
- Bicycle or Pedestrian Crash Event Locations from 2000-2004, during school transportation times, within walk zone. Number of crash events listed in the Legend (yellow star, source: Volusia County GIS)
- Bicycle or Pedestrian Crash Event Locations from 2000-2004, during school transportation times, outside of walk zone. Number of crash events listed in the Legend (red star, source: Volusia County GIS)
- Existing Votran Routes and Transit Stops (dashed yellow lines with squares, source: State of Florida GIS).

Planned Conditions:

- Planned State of Florida sidewalk and roadway improvements (medium blue roadway line, source: FDOT website, State or County GIS) (RGB=153, 204, 255)
- Planned Volusia County sidewalk and roadway improvements (medium green roadway line, source: Volusia County website, GIS, County staff) (RGB=51, 204, 51)
- Planned City sidewalk improvements (violet roadway line, source: city/Volusia County staff) (RGB=169, 80, 176)

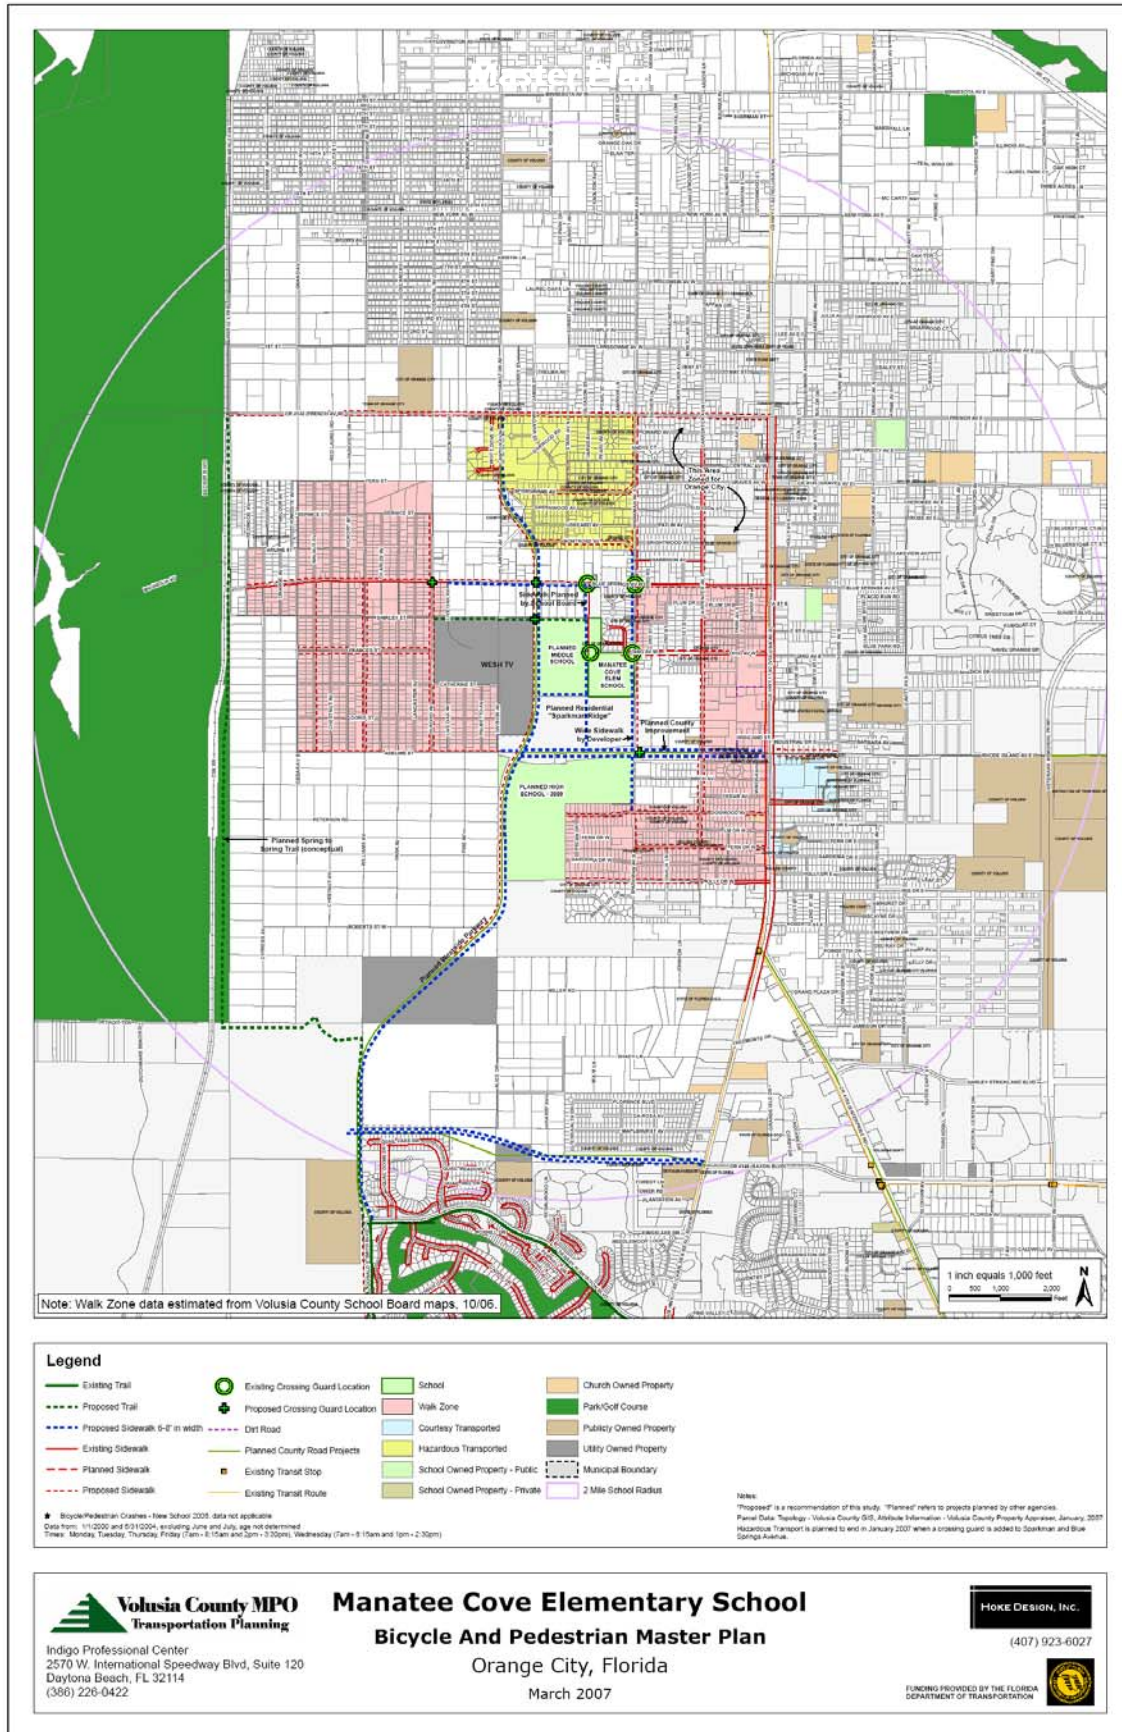

Recommendations of this Study:

- Proposed Trails (dashed dark green line)
- Proposed Sidewalks 6-8' wide (dashed blue line)
- Proposed Sidewalks 5' (dashed red line)
- Proposed Crossing Guard Locations (green cross)

A 24"x36" fold-out map is included in the pocket of this notebook, with a reduced version provided as a reference on the following page.

This Master Plan and supplemental information supplied within the Assessment Report are meant as a guideline for sidewalk and trail planning. The Master Plan is not an engineering document.

Note: The RGB color specification is provided for GIS users who wish to match colors.

Appendix B – Policies and Mandates - Summary

B. Policies and Mandates – Summary

The Volusia County MPO takes its bicycle and pedestrian safety and school transportation planning mandates from various federal, state and local statutes, codes and plans. In addition, these documents lay out the guidelines and procedures relevant to school walk zone safety. This appendix is meant as a high level summary and introduction to these policies and mandates. Links to the full text of documents are provided for further information.

Federal Code

Federal Aid Highway Act (23 USC Sec. 134) - specifies that urbanized areas with populations of 50,000 or more establish Metropolitan Planning Organizations to “provide for the development and integrated management and operation of transportation systems and facilities (including pedestrian walkways and bicycle transportation facilities) that will function as an intermodal transportation system for the metropolitan area.....”

(Available at <http://uscode.house.gov/uscode-cgi/fastweb.exe?getdoc+uscview+t21t25+3930+0++%28Federal%20Aid%20Highway%20Act%29%20AND%20%28%2823%29%20ADJ%20USC%29%3ACITE%20AND%20%28USC%20w%2F10%20%28134%29%29%3ACITE%20%20%20%20%20%20%20%20%20%20>)

The Federal Safe, Accountable, Flexible, Efficient Transportation Equity Act – A Legacy for Users (23 USC 402) –signed into law in 2005. Known as SAFETEA-LU, the act established and funded the [Federal Safe Routes to School Program](#) to make it safer for children to walk or bicycle to primary or middle school. Section 1404 of SAFETEA-LU lays out the purposes of the Act and prescribes apportionment of funds. Projects eligible for funding are described in the following excerpt from Section 1404:

(f) Eligible Projects and Activities.—(1) *Infrastructure-related projects.*—

(A) In general.--Amounts apportioned to a State under this section may be used for the planning, design, and construction of infrastructure-related projects that will substantially improve the ability of students to walk and bicycle to school, including sidewalk improvements, traffic calming and speed reduction improvements, pedestrian and bicycle crossing improvements, on-street bicycle facilities, off-street bicycle and pedestrian facilities, secure bicycle parking facilities, and traffic diversion improvements in the vicinity of schools.

(B) Location of projects.--Infrastructure-related projects under subparagraph (A) may be carried out on any public road or any bicycle or pedestrian pathway or trail in the vicinity of schools.

(2) Non-infrastructure-related activities.—

(A) In general.--In addition to projects described in paragraph (1), amounts apportioned to a State under this section may be used for non-infrastructure-related activities to encourage walking and bicycling to school, including public awareness campaigns and outreach to press and community leaders, traffic education and enforcement in the vicinity of schools, student sessions on bicycle and pedestrian safety, health, and environment, and funding for training, volunteers, and managers of safe routes to school programs.

Florida Statutes

- **S.163.3177 Required and optional elements of comprehensive plan; studies and surveys** - requires every comprehensive plan to include a "traffic circulation element consisting of the types, locations, and extent of existing and proposed major thoroughfares and transportation routes, including bicycle and pedestrian ways."
http://www.leg.state.fl.us/statutes/index.cfm?App_mode=Display_Statute&Search_String=&URL=Ch0163/SEC3177.HTM&Title=-%3e2006-%3eCh0163-%3eSection%203177#0163.3177
- **S.206.60 County tax on motor fuel** – authorizes use of the proceeds from the county fuel tax for acquisition of rights-of-way, construction and maintenance of transportation facilities including bicycle paths and pedestrian pathways.
http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&Search_String=&URL=Ch0206/SEC60.HTM&Title=-%3e2006-%3eCh0206-%3eSection%2060#0206.60
- **S.260 Florida Greenway and Trails Act**
 - S.260.014 – Describes conditions for designating land as part of the Florida Greenways and Trails System
 - S.260-0125 – Describes limits on liability of private landowners whose property is designated as part of the statewide system of greenways and trails.
http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&URL=Ch0260/titl0260.htm&StatuteYear=2006&Title=%2D%3E2006%2D%3EChapter%20260
- **S. 355.066 Safe Paths to Schools Program** – establishes the Safe Paths to Schools Program within the Florida Department of Transportation.
http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&Search_String=&URL=Ch0335/SEC066.HTM&Title=-%3e2006-%3eCh0335-%3eSection%20066#0335.066
- **S. 335.067 Conserve by Bicycle Program** – establishes the Conserve by Bicycle program within the Florida Department of Transportation.
http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&Search_String=&URL=Ch0335/SEC067.HTM&Title=-%3e2006-%3eCh0335-%3eSection%20067#0335.067

- **S. 339.175 Metropolitan planning organization** – assigns responsibility to Metropolitan Planning Organizations (MPO's) for developing transportation plans and programs which "provide for the development and integrated management and operation of transportation systems and facilities, including pedestrian walkways and bicycle transportation facilities that will function as an intermodal transportation system for the metropolitan area...." http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&Search_String=&URL=Ch0339/SEC175.HTM&Title=-%3e2006-%3eCh0339-%3eSection%20175#0339.175
- **S.375.251 Limitation on liability of persons making available to public certain areas for recreational purposes without charge** – describes limits on liability for persons making available land, water areas and park areas for public outdoor recreational purposes. http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&Search_String=&URL=Ch0375/SEC251.HTM&Title=->2006->Ch0375->Section%20251#0375.251
- **S.1013.36 Educational Facilities - Site Planning and Selection** – allows school boards to request county and municipal governments to construct and maintain sidewalks and bicycle trails within a two mile radius of each school. http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&URL=C/h1013/ch1013.htm
- **S.1006.23 – Hazardous Walking Conditions** - lays out requirements for reporting, investigating and correcting any hazards within the two mile radius of school walk zones, or for providing precautions to safeguard students. Defines criteria for hazardous walking conditions in the excerpt below:
 - (a) Walkways parallel to the road.--
 1. It shall be considered a hazardous walking condition with respect to any road along which students must walk in order to walk to and from school if there is not an area at least 4 feet wide adjacent to the road, having a surface upon which students may walk without being required to walk on the road surface. In addition, whenever the road along which students must walk is uncurbed and has a posted speed limit of 55 miles per hour, the area as described above for students to walk upon shall be set off the road by no less than 3 feet from the edge of the road.
 2. The provisions of subparagraph 1. do not apply when the road along which students must walk:
 - a. Is in a residential area which has little or no transient traffic;
 - b. Is a road on which the volume of traffic is less than 180 vehicles per hour, per direction, during the time students walk to and from school; or
 - c. Is located in a residential area and has a posted speed limit of 30 miles per hour or less.

(b) Walkways perpendicular to the road.--It shall be considered a hazardous walking condition with respect to any road across which students must walk in order to walk to and from school:

1. If the traffic volume on the road exceeds the rate of 360 vehicles per hour, per direction (including all lanes), during the time students walk to and from school and if the crossing site is uncontrolled. For purposes of this subsection, an "uncontrolled crossing site" is an intersection or other designated crossing site where no crossing guard, traffic enforcement officer, or stop sign or other traffic control signal is present during the times students walk to and from school.

2. If the total traffic volume on the road exceeds 4,000 vehicles per hour through an intersection or other crossing site controlled by a stop sign or other traffic control signal, unless crossing guards or other traffic enforcement officers are also present during the times students walk to and from school.

Traffic volume shall be determined by the most current traffic engineering study conducted by a state or local governmental agency.

http://www.flsenate.gov/Statutes/index.cfm?App_mode=Display_Statute&Search_String=&URL=Ch1006/SEC23.HTM&Title=-%3e2006-%3eCh1006-%3eSection%2023

HB 147, if passed, would substantially expand these criteria, amending S.1006.23 as defined in the excerpt below, with relevant changes underlined:

(a) Walkways parallel to the road.—

1. It shall be considered a hazardous walking condition with respect to any road along which students must walk in order to walk to and from school if there is not an area at least 4 feet wide adjacent to the road, having a surface upon which students may walk without being required to walk on the road surface. In addition, whenever the road along which students must walk is uncurbed and has a posted speed limit of 35 miles per hour, the area as described above for students to walk upon shall be set off the road by no less than 3 feet from the edge of the road.

2. The provisions of subparagraph 1. do not apply when the road along which students must walk:

a. Is in a residential area which has little or no transient traffic;

*b. Is a road on which the volume of traffic is less than 180 vehicles per hour, per direction, during the time students walk to and from school;
or*

c. Is located in a residential area and has a posted speed limit of 30 miles per hour or less.

(b) Walkways perpendicular to the road.--It shall be considered a hazardous walking condition with respect to any road across which students must walk in order to walk to and from school:

1. If the traffic volume on the road exceeds the rate of 360 vehicles per hour, per direction (including all lanes), during the time students walk to and from school and if the crossing site is uncontrolled. For purposes of this subsection, an "uncontrolled crossing site" is an intersection or other designated crossing site where no crossing guard, traffic enforcement officer, or stop sign or other traffic control signal is present during the times students walk to and from school.

2. If the total traffic volume on the road exceeds 4,000 vehicles per hour through an intersection or other crossing site controlled by a stop sign or other traffic control signal, unless crossing guards or other traffic enforcement officers are also present during the times students walk to and from school.

3. If the road has six or more lanes whether the intersection or crossing site is controlled or uncontrolled.

(c) Residents designated as sexual predators or sexual offenders.--It shall be considered a hazardous walking condition with respect to any road along which students must walk in order to walk to and from school if a resident on the road has been designated as a sexual predator under s. 775.21 or a sexual offender under s. 943.0435 whose victims include a minor.

County Plans and Code

- **The Volusia County Comprehensive Plan, Transportation Element (Chapter 2) - Bicycle and Pedestrian (Section G)** – describes goals, objectives and efforts to improve bicycle and pedestrian safety. <http://volusia.org/growth/02%20Transportation.pdf>
- **The Volusia County Comprehensive Plan, Transportation Element (Chapter 2) - Goals, Objectives and Policies (Section J)** – puts efforts to develop a County-wide Bicycle and Pedestrian Systems Plan within the context of the County's goal to provide a coordinated multimodal transportation system. <http://volusia.org/growth/02%20Transportation.pdf>
- **The Volusia County Comprehensive Plan, Conservation Element (Chapter 12), Air Quality (Section 3)** – outlines County policy to encourage alternative modes of transportation to improve air quality. Gives implementation details for this effort. <http://volusia.org/growth/12%20Conservation.pdf>
- **The Volusia County Comprehensive Plan, Recreation and Open Space Element (Chapter 13)** – lists the County's goals and objectives for a parks and recreation system, and establishes a mandate for the County to work with the

MPO to maintain a County-wide bicycle facilities plan.

Appendix C – General Costs, Funding and Assistance Resources

C. General Costs, Funding and Assistance Resources

For budgeting and planning purposes, local agencies may use the following chart to estimate general costs of different bicycle and pedestrian facilities. Costs are provided by the linear foot. Shorter facilities typically cost more to construct per linear foot than longer facilities. Right of way costs, if applicable, are not included.

Estimated Linear Foot Costs for Bicycle and Pedestrian Facilities (Cost includes survey, engineering and construction)		
Description	Conditions	Cost Range
5' wide concrete sidewalk	Minor drainage impacts, fewer than 10 driveway cuts requiring pipe and mitered end sections, minimal clearing and grading	\$78 to \$89 per linear foot
5' wide concrete sidewalk	Same as above but includes major drainage impacts	\$145 to \$190 per linear foot
6' wide concrete sidewalk	Minor drainage impacts, fewer than 10 driveway cuts requiring pipe and mitered end sections, minimal clearing and grading	\$90 to \$100 per linear foot
8' wide concrete sidewalk	Minor drainage impacts, fewer than 10 driveway cuts requiring pipe and mitered end sections, minimal clearing and grading	\$115 to \$125 Per linear foot
12' asphalt trail (4" lime-rock base and 2" asphalt)	Minor drainage impacts, fewer than 10 driveway cuts requiring pipe and mitered end sections, minimal clearing and grading	\$158 to \$173 per linear foot
5' wide asphalt bike lanes	Minor drainage impacts, fewer than 10 driveway cuts requiring pipe and mitered end sections, minimal clearing and grading	\$80 to \$100 per linear foot

Note: Survey and engineering were factored at 20% of cost. Site access, extended side slopes, barriers, retaining walls and railings are not included in the above cost ranges. Overall size of the project will impact linear foot costs. Costs are based on FY 2006 cost averages.

The following charts provide sources for grants and assistance. Funding amounts, matching requirements and submittal dates frequently change and should be verified yearly.

Grant Name	Submission Date	Funding Range	Match Req.	Project Type	Contact
Recreational Trails Program	Annually-- usually scheduled for 1st Qtr. each calendar year.	Maximum grants for mixed-use and non-motorized projects is \$200,000. Maximum grant for motorized project is \$437,420.	Choose either 50:50, 60:40, 80:20. Higher match equals higher points for overall grant score.	Projects that construct, renovate or maintain recreational trails, trailhead and trailside facilities and the purchase of trail construction or maintenance equipment	http://www.dep.state.fl.us/gwt/grants/ Alexandra Weiss (850) 245-2052 alexandra.weiss@dep.state.fl.us
Safe Routes to Schools (SAFETEA LU)	Infrastructure projects - February. Non-infrastructure projects - call for information.	Florida's projection for 2007 is \$6,133,717	No match required	Eligible applicants are Community Traffic Safety Teams, School Boards (for public schools), and private schools. Partnership with government agency sponsor typically required. Non-infrastructure projects such as Education, Encouragement, Enforcement, and Evaluation. Infrastructure projects such as bicycle or pedestrian facilities, traffic calming and traffic control devices. Policy development, planning and implementation of strategies such as improvement to streets and sidewalks, education and encouragement of children and parents and increased enforcement of traffic laws.	http://www.dot.state.fl.us/safety/SRTS_files/SRTS%20Guidelines%2011-20-06.pdf Infrastructure - Tony Nosse, anthony.nosse@dot.state.fl.us 386-943-5334 Non-infrastructure - Joan Carter Pedestrian/Bicycle Coord. joan.carter@dot.state.fl.us 386-943-5335
XU Funding	Annually, 1st quarter	Varies	50% match	Bicycle and pedestrian facilities.	Stephan Harris, Volusia County MPO 386-226-0422 Ext. 34 scharris@co.volusia.fl.us
Transportation Enhancement Program - Statewide	Generally follows the annual updating of the FDOT five year work program - call for information	\$13 million for FY 2008/2009 and FY 2009/2010	No match required	Bicycle and pedestrian facilities, safety and educational activities for pedestrians and bicyclists	http://www.dot.state.fl.us/emol/enhance/enhance.htm Bob Crim (850) 487-3982 bob.crim@dot.state.fl.us or Florida Department of Transportation (850) 414-5269
Transportation Enhancement Program - Local	Annually, 1st quarter	\$45-\$50 Million allocated among 7 FDOT districts, no cap	No match required	Bicycle and pedestrian facilities	www.dot.state.fl.us/emol/enhance/mpoma.pdf Stephan Harris, Volusia County MPO 386-226-0422 Ext. 34 scharris@co.volusia.fl.us
Rivers, Trails and Conservation Assistance Program	Annually by August	Technical assistance only, no direct funds are available	Technical assistance only, no direct funds are available.	Provides staff assistance for river, trail and conservation projects. Selected projects have included conceptual plans for trail corridors, river corridor plans, and statewide river assessments	http://www.nps.gov/nrcr/programs/rtca/ Jaime Doubek-Racine (941) 330-8047 jaime_doubek-racine@nps.gov

Grant Name	Submission	Funding Range	Match Req'd.	Project Type	Contact
Community Development Block Grant	Annually by August	Formula based on community needs	No match required	Funding for property acquisition, improvements to neighborhood parks and facilities, new and resurfaced streets, sidewalk installation, wastewater collection improvements, and economic development projects.	http://www.volusia.org/community_assistance/cdbg.htm Paula Szabo at pszabo@co.volusia.fl.us or (386) 943-7039 ext. 2308
Urban & Community Forestry Grant	January	Maximum grant is \$10,000 to \$25,000, depending on type of project	50:50 match ratio	Tree ordinance development or revision, tree inventories, management plans, master plans, in-house training, staffing, student interns, and equipment purchases	http://www.fl-dof.com/forest_management/cfa_urban_grants.html Charlie Marcus (850) 921-0300 or marcus@doacs.state.fl.us
Florida Rails-to-Trails	N/A	No direct funding	N/A	Helps make funding opportunities available for trail projects and assists in learning about funding opportunities	(850) 488-3701 or jessicat@railstrails.org
Florida Greenways & Trails Acquisition Program	Annually, typically in fall - need notification of funding	\$4.5 Million (no cap)	No match required	Acquisition of land for greenways and trails	Cindy Radford (850) 488-3701 cynthia.radford@dep.state.fl.us
Florida Communities Trust Program	May 10, 2006	One application not to exceed 15% of funds available/Multiple applications not to exceed 10% of funds available		Acquisition of land for community-based parks, open spaces and greenways that further the outdoor recreation and natural resource protection needs identified in local government comprehensive plans.	Ken Reedy (850) 922-2207 or ken.reedy@dca.state.fl.us
Florida Recreation Development Assistance Program (FRDAP)	Fall	\$11.5 Million, max award \$200,000 divided among acquisition, development, trails	0% match-\$50,000 or less 25% match-\$50,001-\$150,000 50% match- over \$150,000	Acquisition or development of land for public outdoor recreation	http://www.dep.state.fl.us/parks/OIRS/default.htm Leylani Velez@dep.state.fl.us (850) 245-2501
Florida Highway Beautiful Council Grant	Fall	Total funding is \$3 million—no single grant to exceed 10% of total funding; however, may apply for more than one grant		Landscape beautification projects on Florida's roadways	http://www.dot.state.fl.us/emo/beauty/council.htm christine.webb@dot.state.fl.us 386-943-5298
Land and Water Conservation Fund Program	Probably not accepting applications in 2007 - call for information.	Announced prior to submission period	50:50 match ratio	Acquisition or development of lands for outdoor recreational purposes	http://www.dep.state.fl.us/parks/OIRS/facts/wcf.htm RitaVentry (850) 245-2501
Grant Name	Submission Date	Funding Range	Match Req'd.	Project Type	Contact
Volusia County Sidewalk Funding		\$500,00 to \$600,000 per year total	None	Sidewalk construction	Jerry Brinton, Volusia County

Grant Name	Submission Date	Funding Range	Match Req.	Project Type	Contact
Volusia ECHO Grants-In-Aid Program	Applicants must attend workshop, typically in July. Application for Technical Completeness Review due in September. Final application deadline December.	Minimum of \$12,500. Standard \$500,000 annually or Exceptional over \$500,000 annually	Standard program requires minimum of 1:1, exceptional program requires 4:1	Acquisition, restoration, construction, or improvements of facilities to be used for environmental/ecological, cultural, historical, or outdoor recreation purposes that must be open for public use. Exceptional program means a project of paramount and crucial county-wide importance and receives more than the standard funding range.	volusiaforever-echo.com Rob Walsh 386-736-5902
Bikes Belong Coalition	Applications reviewed on a quarterly cycle.	up to \$10,000 each		Bicycle facilities	Elizabeth Train (303) 449-4893 or Elizabeth@bikesbelong.org
Conservation Technology Support Program	January, each year	Packages of equipment and software donated by vendors to non profit organizations		Grant packages of computers, printers, software and training for tax-exempt conservation organizations building GIS capacity.	www.cfsd.org
American Greenways Kodak Awards Program	June 1, each calendar year	\$500 to \$2500		Seed money to stimulate greenway planning and design	http://www.conservationfund.org/?article=2372 (703) 525-6300 or emeyers@conservationfund.org
National Trails Endowment - American Hiking Society	November of calendar year	\$500 to \$10,000- Maximum of \$10,000 per project		Acquisition, developing, building constituencies	Ivan Levin (301) 565-6704 x 208 or llevin@AmericanHiking.org
The Trust for Public Land Conservation Services Program	N/A	No direct funding	N/A	Helps communities and governments identify funds to protect land. Also, helps ensure completion of the transaction.	kevin.mooney@tpal.org

Appendix D – Safe Routes to School Program Summary

D. Safe Routes to School Program Summary

(Source: Florida Department of Transportation, March 2007)

Florida's

Application Guidelines

Walking or biking to school gives children a sense of freedom and responsibility, allows them to enjoy the fresh air, and provides opportunities to get to know their neighborhood while arriving at school alert, refreshed, and ready to start their day. Yet most American children are denied this experience. In fact, only 13 percent of American children walk or bike to school. Communities and community-based organizations are devoting increased attention to pedestrian and bicycle safety issues in an effort to reduce the dangers usually associated with walking or biking to school.

A successful Safe Routes to School (SRTS) Program integrates health, fitness, traffic relief, environmental awareness, and safety under one program. The Safe Routes to School program encompasses routes and techniques used to encourage children in Kindergarten through eighth grade, to walk to or from school. While SRTS funds will not cover all the identified needs, they can help communities get started on addressing their school transportation needs and encourage more students to walk or bike to school. School principals, school district officials, private school officials, local transportation officials, and Community Traffic Safety Teams are encouraged to cooperate to apply for these funds.

Note: Guidelines, Applications, and District Contact Information sheets will be updated periodically. Check edition dates at the bottom of each document with our website: www.srtsfl.org

Program Purpose

SRTS is a new federal reimbursement program to enable and encourage children in grades K-8, including those with disabilities, to walk and bicycle to school; to make walking and bicycling to school safer and more appealing; and to facilitate the planning, development, and implementation of projects that will improve safety and reduce traffic, fuel consumption, and air pollution in the vicinity of schools. In addition to encouraging more children to walk or bike to school, the program also seeks to address the safety needs of children already walking or bicycling in less than ideal conditions.

Eligible Schools, Applicants and Sponsors

Eligible schools are public and private schools serving Kindergarten through 8th grade. Eligible applicants are Community Traffic Safety Teams (**Chair or Vice-Chair**), School Boards (**Chair, Vice-Chair or their designee**, for public schools), and private schools (**Headmaster, Assistant Headmaster or their designee**). However, most applicants will also have to partner with a sponsor (a government agency which is able to enter into a legal agreement with Florida Department of Transportation and provide the initial funding before being reimbursed). **Examples of legal agreements which might be used are Local Area Program (LAP) Agreements, Local Funding Agreements, or Joint Participatory Agreements (JPAs, for non-infrastructure activities only).** Sponsors would not be needed in the following cases:

- If the proposed infrastructure project could be done by the FDOT District on a state road; or
- If the applicant for the proposed non-infrastructure activity is prepared to (1) enter into a legal agreement with the Florida Department of Transportation and (2) fund the activity until reimbursed by FDOT, as described below

Every applicant is encouraged to enlist the assistance of other relevant participants in the development

and submittal of an application. Examples are elected officials, Metropolitan Planning Organizations, appropriate county and city agencies, and non-profit organizations.

Funding

Florida's SRTS Program is 100 percent federally funded and managed through the Florida Department of Transportation (FDOT), by a cost-reimbursement process. Projects will be awarded through a District-wide competitive process. Seventy to ninety percent of each District's SRTS funds will be dedicated to infrastructure (Engineering or construction) projects, with the remaining funds going toward non-infrastructure activities (Education, Encouragement, Enforcement, and Evaluation). Infrastructure projects may be located on or off the state highway system; however, they must be on public property, within a two-mile radius of the school. Important points to remember:

- Due to the limited SRTS funding, applicants are encouraged to be as cost effective as possible in order for funds to stretch as far as possible.
- SRTS funds may not be used to supplant existing funds.

Comprehensive Program

The SRTS Program is unique in its overriding emphasis on community participation in the development and implementation of a project. By involving the public, schools, parents, teachers, children, local agencies, the businesses community, key professionals, and others in the development of a project proposal, a comprehensive and integrated solution to improving safety is likely to develop and be sustained beyond the life of the project. Projects and activities that have the best chance of being selected for funding under the SRTS program are those that incorporate all of the key elements referred to as the five E's – Education, Encouragement, Enforcement, Evaluation, and Engineering. The five E's are explained further in the sections that follow. **Applicants are required to summarize in their application what they have already done and what they plan to do to address each of the E's.**

Evaluation is an integral part of the SRTS process, and is required both in the application phase and the implementation phase, for projects and activities selected. The pre-application data-gathering requested includes such information as:

- How students currently travel to and from school
- What conditions in the school zone or immediately around the school site discourage children from walking or bicycling to or from school
- What conditions within a two-mile radius of the school discourage children from walking or bicycling to or from the school
- Opinions of parents about these conditions and allowing children to walk or bicycle to or from school
- What solutions the evaluators recommend to solve identified problems

A process for gathering this information, as well as implementation suggestions, are presented in the Safe Ways to School Toolkit, which can be downloaded from:

www.dcp.ufl.edu/centers/trafficSafetyEd/html_safe-ways.html

If your project or activity is selected for funding, you will be required to collect evaluation data using the two national SRTS surveys (student transportation survey and parents' survey) a few months before and after the project or activity is implemented. These forms may also be used as part of the application process, and can be found at: www.saferoutesinfo.org/resources/index.cfm

Appendix E – Right of Way Regulations

E. Right of Way Regulations

The Florida Department of Transportation (FDOT) has overall responsibility to the Federal Highway Administration (FHWA) for right of way acquisition on any project in Florida using federal funds, or on which federal funds are anticipated to be utilized, on any phase of the project. In practical terms, this means that the Florida Department of Transportation requires local governments and agencies to follow federal guidelines for right-of way acquisition in any project using federal funds, including Safe Routes to School funds.

The federal guidelines stem from the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 as amended. These guidelines must be followed regardless of whether a project's federal funding is directly used for right of way acquisition or whether that project will become part of the state highway system. As part of federal guideline compliance, *FDOT requires both local agency pre-qualification and right of way project authorization prior to project start.*

FDOT representatives also wish to emphasize the need for temporary easements or rights of entry for construction activity that may extend outside of the right of way.

Local Agency Program Pre-Qualification

Under federal guidelines, local Florida agencies wishing to acquire right of way for a project using federal funds must pre-qualify with FDOT *before* initiating right of way activities. To pre-qualify, agencies must submit the following:

1. Documentation showing the adequacy both in quantity and experience of the staff and organization to provide services in conformance with all applicable laws and regulations.
2. A statement detailing the process and identifying the agency official or entity with authority for:
 - (a) Establishing just and full compensation (normally a qualified review appraiser(s);
 - (b) Approval of administrative and legal settlements and settlements of attorney fees and costs (a separate agency official or entity from that named in (a);
 - (c) Granting final agency acceptance of purchase agreements, as applicable;
 - (d) Reviewing relocation assistance appeals; and
 - (e) Executing deeds, easements, leases and contracts.
3. A Project Assurance Statement, pursuant to the 49 CFR 24.4(a) wherein the local agency provides assurances that it will conduct its right of way acquisition and relocation assistance programs in compliance with the provisions of the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended, and in compliance with 49 CFR Part 24. The Project Assurance Statement must also provide an assertion that the local agency is fully empowered to comply with these requirements under state and local law.
4. A signed statement detailing the acceptance of responsibility for reporting real estate transactions to I.R.S. pursuant to 26 CFR Part 1.6045.

During the local agency program pre-qualification process, the agency may also request right of way pre-qualification in certain areas. However, organization, staffing level and expertise must be pre-certified on a project by project basis.

Further requirements for prequalification are listed in FDOT's "Right Of Way Procedures," available at <http://www2.dot.state.fl.us/proceduraldocuments/procedures/bin/525010300/Ch02s05.pdf>.

Right of Way Project Authorization

After pre-qualification, local agencies must also obtain right of way project authorization from FDOT. To obtain authorization, agencies must submit two copies of the following to the FDOT District Local Agency Program Administrator:

1. A Project Information Summary
2. Final right of way maps
3. A Statement of Topographic Field Review
4. The Right of Way Project Cost Estimate
5. Form FHWA-37, Federal Project Status Report

Additional requirements for right of way acquisition, including compliance with various other federal regulations, are listed in "Right of Way Procedures," available at <http://www2.dot.state.fl.us/proceduraldocuments/procedures/bin/525010300/Ch02s05.pdf>.

Appendix F - Crash Event Summary

F. Crash Event Summary

Manatee Cove Elementary School opened in 2006. Crash data is not available for this time period.

Appendix G - Votran Coordination

G. Votran Coordination

Votran provides over three million rides per year to Volusia County citizens, including transportation to and from school for some public school students. The design and location of Votran bus stops directly affects those students using Votran to get to school, but also has an impact on overall school walk zone safety.

Ensuring students have safe routes between bus stops and schools is a primary concern. In addition, bus stops of all types create secondary concerns:

- Votran bus stops and middle school and high school bus stops add pedestrian traffic in concentrated bursts to roadways and sidewalks, affecting all traffic within an elementary school walk zone
- Bus stops can create conflicting uses of sidewalks in school walk zones (i.e. students bicycling to school might ride through a group of people waiting for a bus).

Hoke Design Inc. recommends that local government agencies, the MPO and the School District staff coordinate with Votran on planning and construction issues that affect bicycle and pedestrian safety.

School Board Considerations

The School District staff may wish to consider providing cities, the County, the MPO and Votran with a list of elementary school, middle school and high school bus stops to provide for increased coordination when planning sidewalk facilities. This will allow planners to minimize any conflicts between Votran and school bus stops, and prioritize sidewalk construction projects that meet multiple needs. For example, the same sidewalk may serve students walking to a middle school bus stop and patrons walking to Votran stops along with elementary students walking or bicycling to school.

The School District staff may also wish to consider notifying Votran of any removals of Hazardous or Unique Conditions status within school walk zones. This will allow Votran to better respond to any increased use of their services by students, including alteration of routes or schedules to accommodate students.

Considerations for Cities, the County and the MPO

Cities, County departments, and the MPO may wish to coordinate with Votran and the School District staff to ensure both school bus and Votran stops are considered when planning sidewalks, trails and transit. Within elementary school walk zones, the first step in these efforts should be to map middle school, high school and Votran bus stop locations. This will allow planners to take into account pedestrian traffic from both school bus and public transit systems when prioritizing sidewalk construction efforts.

Local government agencies should work with Votran to optimize public transit stop locations. Best practices for location of bus stops include:

- Locate stops where there is a safe place to stand or sit away from the road while waiting
- Place stops in the shade when possible (provide shelters whenever feasible)
- Locate stops along areas with existing sidewalks and provide a paved connection to the waiting area.
- Provide safe connections from area trails and bike lanes, and pedestrian connections to nearby destinations (schools, shopping, parks, offices, etc.)
- Review routes for hazards
 - In rights of way where sidewalks not provided
 - In areas not well-lit
 - For small children, elderly, stroller use, and those with disabilities.

If a bus stop location must be provided in areas where there are no sidewalks, government agencies should coordinate sidewalk planning and construction efforts with all players to find funding sources.

Best practices for enhancing bus patron comfort and safety include:

- Where right of way is available, add paved waiting or accessory pads at stops
- Add bicycle racks to bus stops
- Provide benches and trash receptacles at stops
- Construct shelters whenever feasible.

Most new Votran routes evolve from the 5 Year Development Plan (TDP) adopted by the County Council after input from the public, elected officials and local leaders, Votran staff and Votran's Service Development Committee. City or county personnel, as well as private citizens, can also request changes in bus routes by sending a written request to Votran for review by the Service Development Committee.

Detailed information on planning for the comfort, safety and convenience of bus stop patrons is contained in two resource documents:

1. "TCRP 19: Guidelines for the Location and Design of Bus Stops"
TCRP (Transit Cooperative Research Program)

(see Chapter 4, Curb-Side Factors)

(Available at http://onlinepubs.trb.org/onlinepubs/tcrp/tcrp_rpt_19-a.pdf)

2. "From Bus Shelters to Transit Oriented Development"
Florida Department of Transportation

Available at
